Quick Start

Install, connect your accounts and tools, and make your first test video

Ninja Video Maker 0.1.29 | November 2026

© 2026 Made by Yasir Ashfaq. All rights reserved.

1. Before you install

You need	Details
Windows 10 or 11, 64-bit	With an internet connection
Free disk space	About 20 GB for the app, its tools and the first videos (more as your footage grows)
Memory	8 GB RAM at least, 16 GB recommended
Graphics card	An NVIDIA card is recommended: faster renders and subtitles, and the local OmniVoice voice. The app also works without one.
Google accounts	One or more, for Antigravity (free)
Your licence key	It looks like NINJA-XXXX-XXXX-XXXX-XXXX

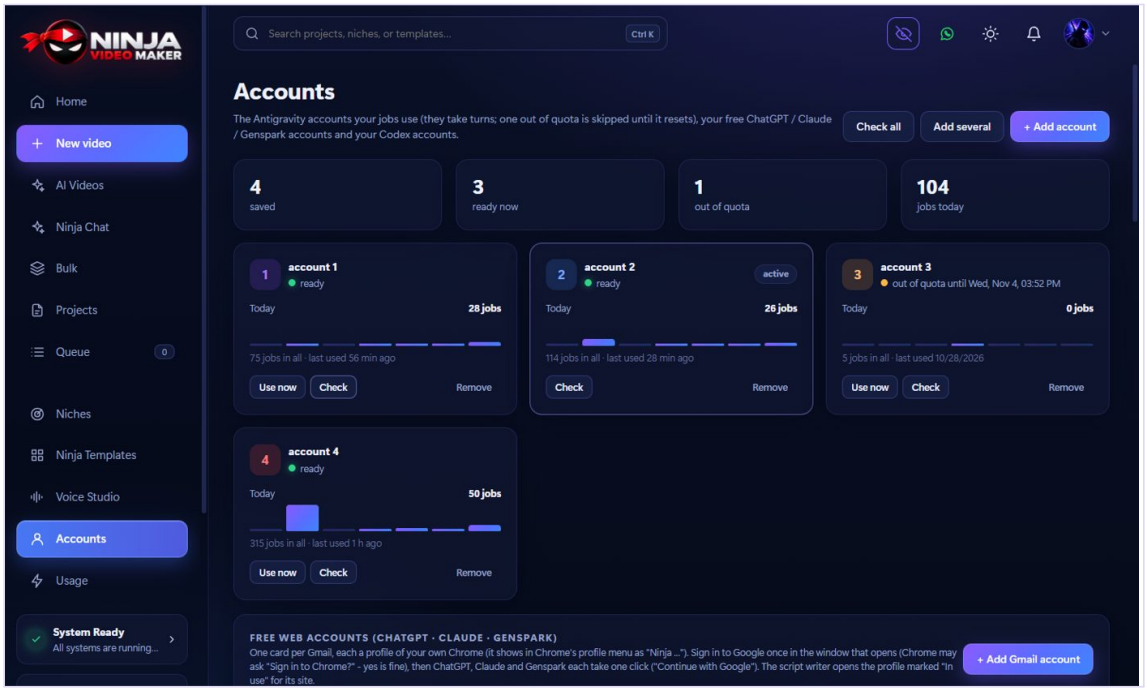

2. Install the app

1. Download the setup file from the link you received with your licence and run **Ninja-Video-Maker-Setup.exe**. If Windows shows a blue SmartScreen window, press **More info**, then **Run anyway**.
2. Open Ninja Video Maker, paste your licence key and press **Activate**.
3. The first start runs the **setup**: it copies the video kit and installs Python, its packages, the Chromium renderer, FFmpeg, the Antigravity CLI, Node.js + HyperFrames and the speech model, then runs a short test. It takes a few minutes (longer on slow internet). Closing the window only pauses it; it carries on where it stopped.
4. When every step shows **done**, the app opens on Home.

> **Tip** Updates come by themselves. When the top bar says "Update ready", press "Restart and update" when no video is running.

3. Connect your Antigravity accounts

Antigravity writes the scripts, does the research, draws AI pictures and checks footage. It is free with a Google account; each account has its own quota, so add several.

Accounts - the Antigravity accounts take turns (Showcase mode shows them as account 1, 2...)

1. Open **Accounts**. If it says the Antigravity CLI is not installed, press **Install Antigravity CLI** (about a minute).
2. Press **+ Add account**. An Antigravity window opens with a Google link - Ctrl+click it (or copy it into your browser).
3. Sign in with the Google account you want to add (a verified account). If the page shows a code, paste it into the Antigravity window and press Enter.
4. The Accounts page picks the account up by itself. Use **Add several** to add more one after another, and **Check all** to test them.

4. Optional helpers

Free web accounts (ChatGPT, Claude, Genspark)

- Accounts > Free web accounts > **+ Add Gmail account**. A Chrome profile opens: sign in to Google once, then to ChatGPT, Claude and Genspark with "Continue with Google". They become free script writers. Google Chrome or Microsoft Edge is needed.

AI images tool (Gemini Images tool)

- A separate tool you get from its owner (it is not part of the app). Extract it, then on the Accounts page under the picture tools press **Choose folder** and pick it.
- Press **Start + open dashboard** and add your Google accounts in its Login section. The app starts it whenever a job needs pictures.
- Without it, Antigravity draws the AI pictures - it just takes longer.

Thumbnail tool (ChatGPT, free)

- On the Accounts page, set up the **ChatGPT thumbnail tool**: a Chrome window opens - sign in to ChatGPT with your email address (Google sign-in is refused in a tool-driven Chrome).

- New videos can then get thumbnails drawn by ChatGPT ("Thumbnails drawn by" in the New video form).

API keys and the default voice

- **Settings > API keys**: add a **Serper** key for much better real pictures (several keys separated by commas). Pexels and Pixabay are free extras. ai33.pro or FameSpeak only if you want premium voices. Press Save on each.
- **Settings > Default voice**: pick one. The free starter voice needs no key.

5. Your first test video

A documentary (Advance and Owner plans)

1. **Niches > + New niche > Set it up myself**: a name (e.g. history-test), a template (Documentary or Simple Edit) and a topic. Or use a niche you already have.
2. **New video**, step 1 Inputs: Script = **Write it from the title**, What to make = One topic, a title such as "How the Hoover Dam Was Built", Length = **1-2 minutes**, and your niche.
3. Step 2 Voiceover: the free starter voice (or your default).
4. Step 3 Look: keep the niche's template and the ticked footage sources.
5. Step 4 Editor & run: **Quick (this PC, fastest)**, then **Start**.

An AI video (every plan)

1. **AI Videos > + New AI niche**: a topic and a picture look.
2. **+ New AI video**: the niche, a title, 1 minute, an animation style - then **Make AI video**.

Watch it and find the files

- Home shows the video step by step: script, voice + subtitles, footage, footage check, editor, stills, render, checks, delivery. A short test takes about 15-30 minutes.
- If the app asks for an approval (script, shot list or stills), look and press Approve.
- When it is done: **Projects** > the video > **Play** or **Folder**. The folder holds the MP4, the SRT, the thumbnails and the YouTube title, description and tags.

6. If something goes wrong

You see	Do this
A video stopped ("Needs your attention" on Home)	Read the reason, then press Retry - it carries on from that step.
"Antigravity is not answering" or an account out of quota	Accounts > Check all; sign in again or add another account.
A video waits and nothing moves	Open the Queue and click its job: the log says what it is doing ("still working - N min" means it is busy, not stuck).
The app says the licence or engine files are not right	Restart the app (it repairs its own files). If it stays, reinstall from your download link.
Anything else	Settings > Kit Doctor > Support report, and send the file to support. It holds no keys or passwords.
